An accomplished executive in business development and business transformation, Fred Slack has co-founded multiple start-ups across a variety of industries. For the past ten years, his endeavors have focused on research and development companies that use a proprietary product as the backbone for many utilities. This “backbone” allows for PFAS Destruction through product innovation and an iterative process design. Fred’s 30+ years of entrepreneurial management success has enabled him to form a team of scientists and engineers dedicated to the development of products focused on bettering the health and environment in communities. The most active company is currently MossParker. MossParker focuses on the complete destruction of PFAS, with no environmental recontamination, providing a better future for all.

MossParker has met diverse contamination control and processing challenges throughout the PFAS industry and has developed a full suite of treatment technologies capable of addressing a variety of contamination levels. These products and processes are tailorable and scalable, dependent on the defined circumstances of volume, contamination level, location, and environmental requirements. MossParker’s depth of technical know-how has contributed to a wide range of processes and creative, reliable technologies that enable them to solve problems for many customer bases.

Prior to the environmental focus, Fred co-founded a software organization focused on business transformation and knowledge management & collaboration tools. The company worked closely with Verizon to complement their contact center-focused business affording them the opportunity to become a global solutions provider. He also worked with IBM as a methods and procedure consultant, as well as program manager for the Air Force Satellite Control with Digital Equipment Corporation (DEC).
